INDIA NEUROLOGY DIRECTORY
Visual Website Build Brief for Claude

A standalone, multilingual, India-first neurological care discovery and education website, inspired by the six provided KneeTie GoRunGo stroke-awareness screenshots.

Executive decision: separate site, shared infrastructure

Recommendation: launch a dedicated India neurology domain and brand, with a discreet “technology by” attribution to TruckYeahTraders only if desired. A healthcare-specific domain makes trust, SEO, hospital outreach, and partnerships clearer. Reuse existing design components, authentication, hosting, and back-office services where technically and legally appropriate. Do not place patient-facing healthcare navigation under a trading-oriented URL.

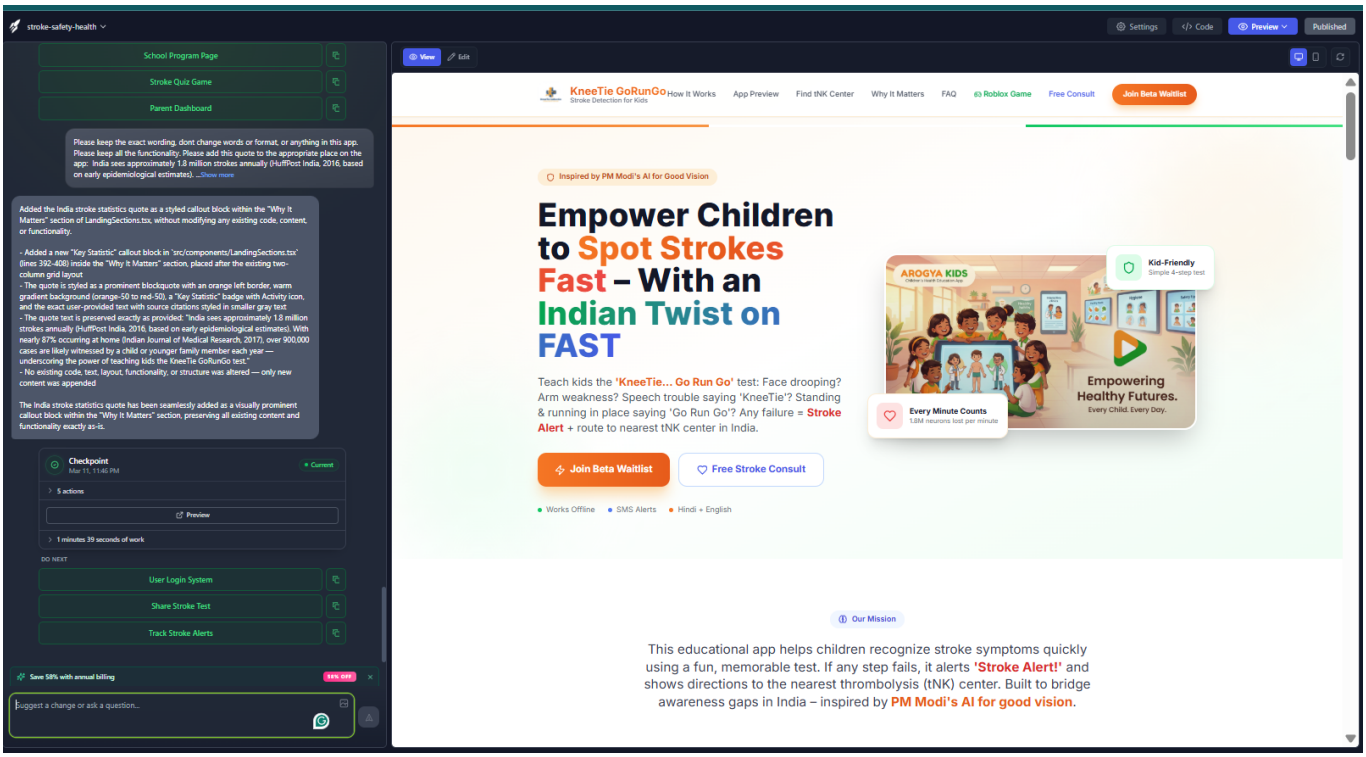

Suggested structure: India Neurology (public site) → Find Care, Conditions, Stroke Emergency, Learn, About, For Providers. TruckYeahTraders remains a separate business site and optional technology partner. Domain and trademark availability require verification before selection.

Product mission and MVP

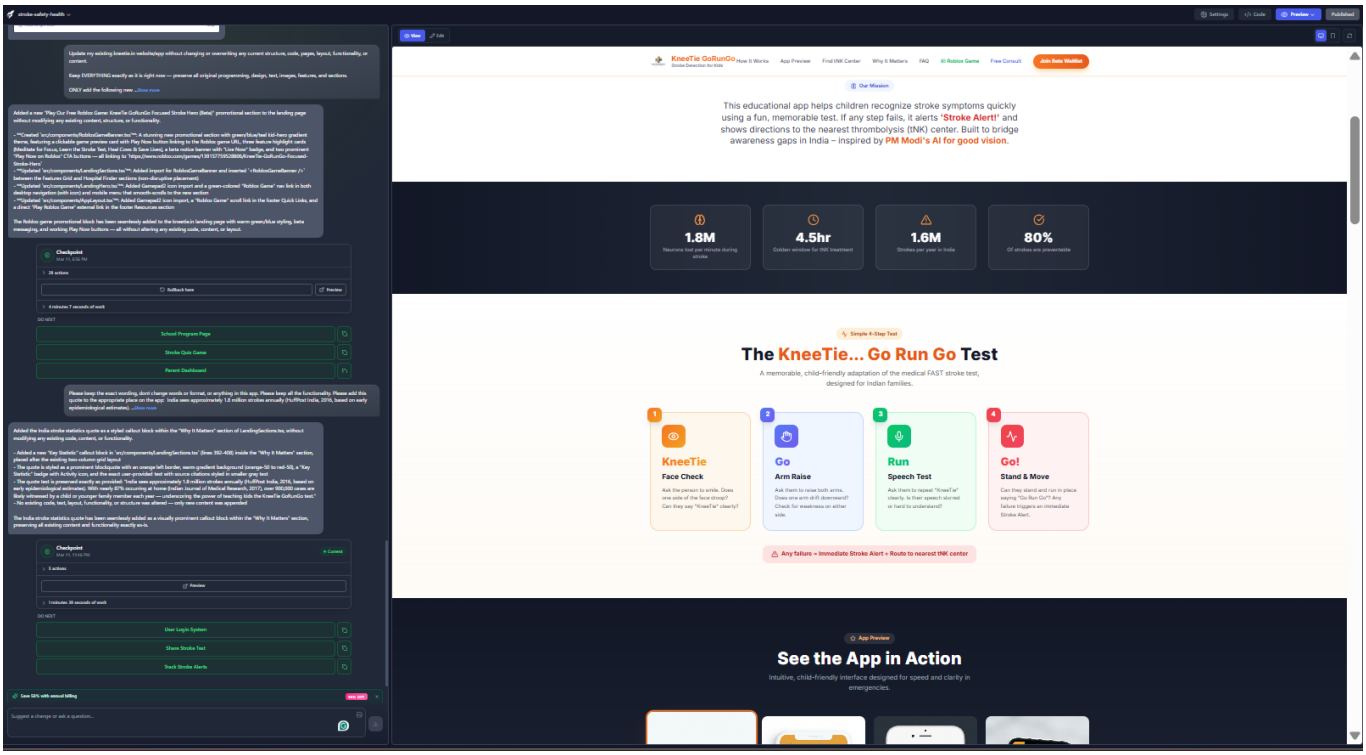

Help people in India understand neurological symptoms and locate relevant, verified care. Start with stroke, epilepsy, headache/migraine, Parkinson disease, dementia, multiple sclerosis, neuropathy, pediatric neurology, neuromuscular disorders, and neurorehabilitation. Present education, not personalized diagnoses.

MVP: mobile-first home page; India state/city directory; filters by specialty, services, language and facility; provider/hospital profile; verified-claim workflow; condition library; stroke warning-signs page; emergency help; bilingual English/Hindi foundation; CMS and moderation dashboard.

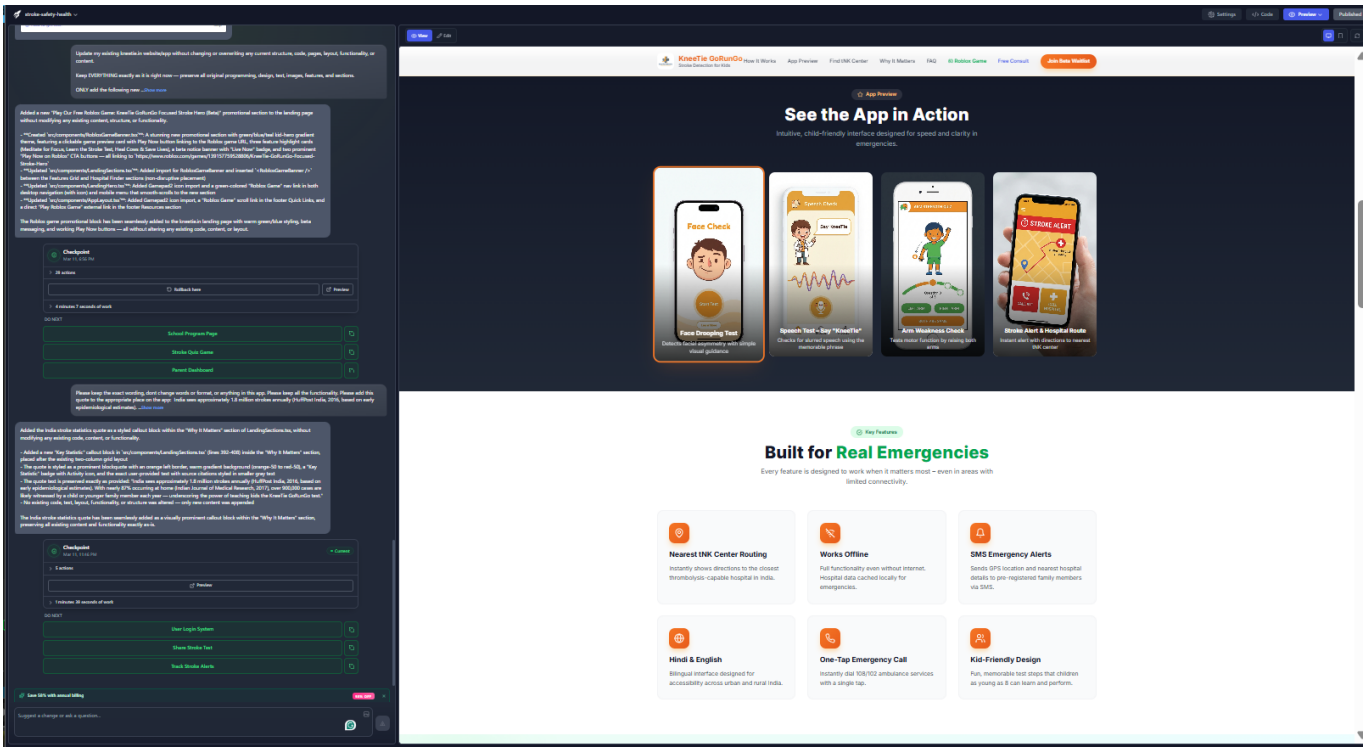

Reference screenshots — preserve and evolve

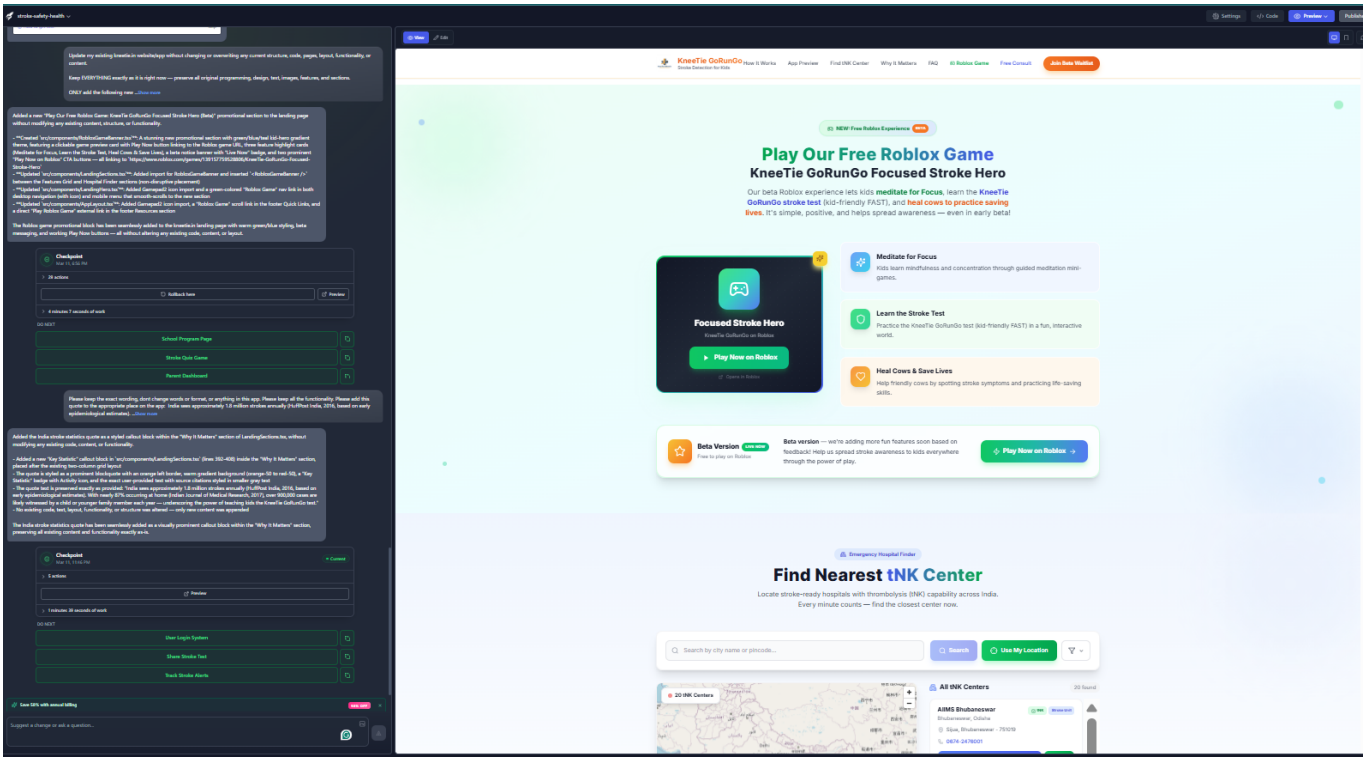

Reference 1: Child-friendly FAST stroke education hero. Preserve the warm, colorful illustration and clear primary call to action.

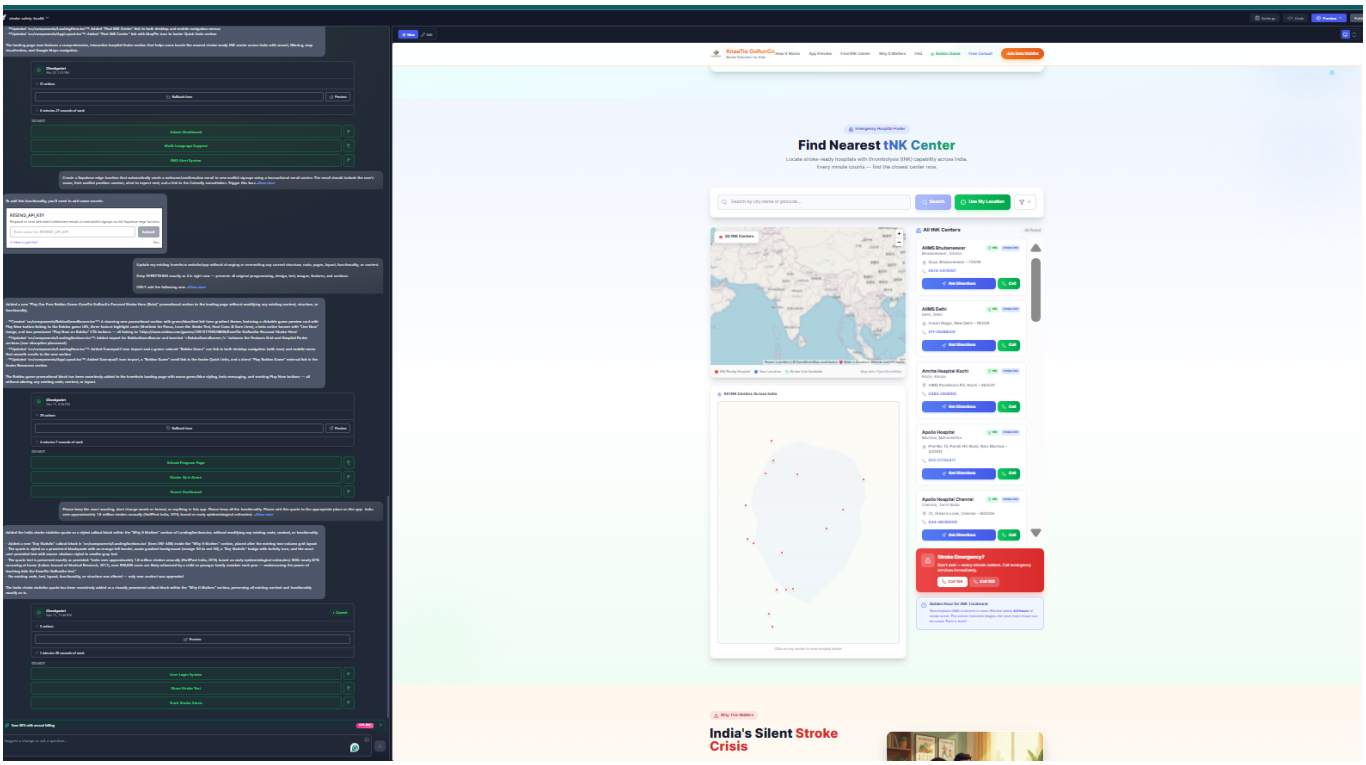

Reference 2: Impact metrics, FAST steps, and app previews. Treat existing figures as illustrative until verified.

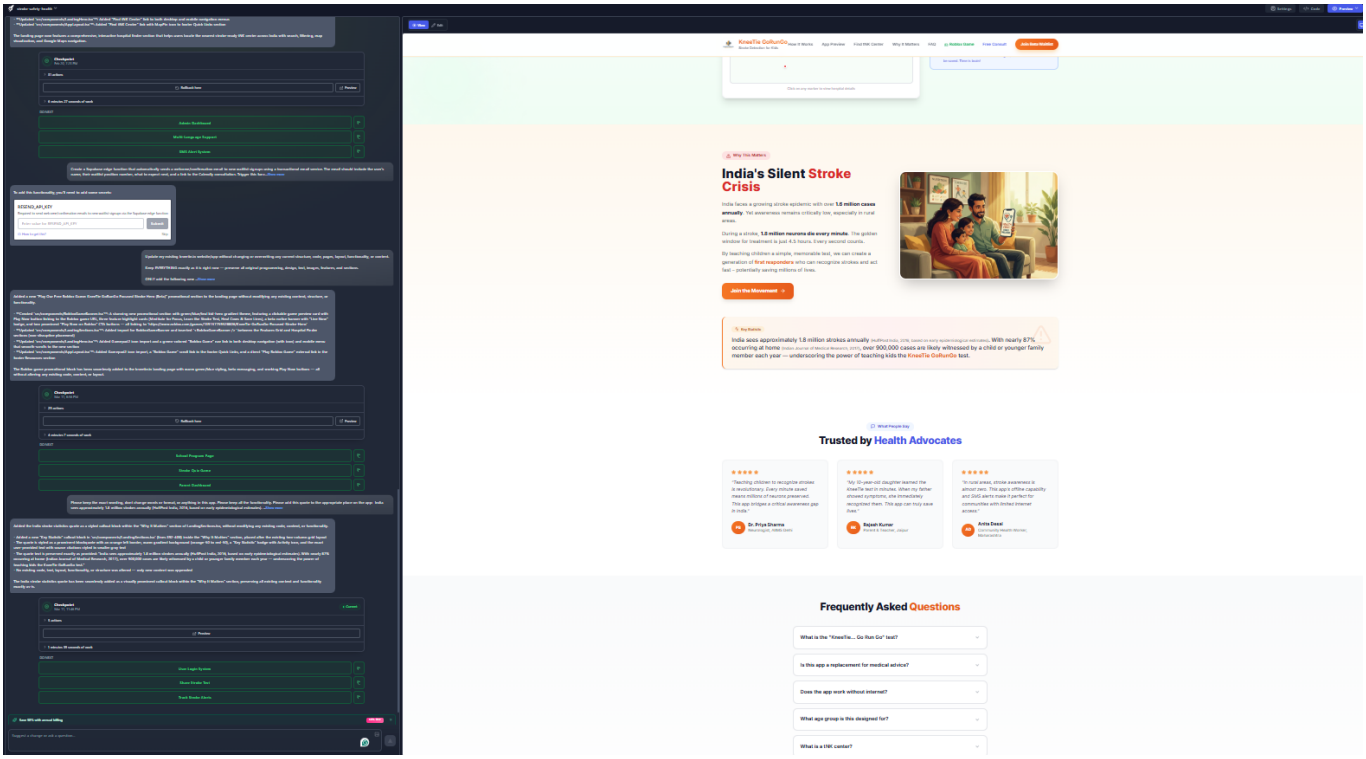

Reference 3: Mobile learning screens and emergency-readiness cards; adapt into stroke learning journeys.

Reference 4: Free stroke learning game plus nearest-center search; retain both as separate entry points.

Reference 5: Map-and-list stroke-center finder. Expand to a filterable India-wide neurology directory.

Reference 6: India stroke-crisis content, ambassador trust area, and FAQs. Rework with sourced medical content.

New website page layouts for Claude

Homepage: top navigation with Find a Neurologist, Find a Hospital, Conditions, Stroke FAST, Resources, Languages; hero headline “Find Neurological Care Across India”; location search with state/city; condition chips; emergency banner; featured educational card; directory preview; footer.

Search results: left filter panel (or mobile drawer); map/list toggle; cards with verified name, city, services, contact, last reviewed date; no invented ratings or treatment capabilities. Sorting by relevance and distance only with reliable geocoding.

Profile: name, qualifications, registration details where verifiable, specialty, location, contact, languages, accessibility, facility services, source/verification status, last update, report-error button. No paid placement masquerading as medical quality.

Condition page: plain-language overview, symptoms, red flags, evaluation, treatment pathways, FAQs, links to nearby relevant care, editorial review date and medical reviewer.

Emergency page: FAST stroke warning signs, immediate emergency-call guidance, avoid delays; India emergency number 112 with local ambulance arrangements verified by region. Never imply the directory is an emergency dispatch service.

Data model and implementation

Tables: providers, facilities, facility_services, conditions, locations, provider_facility_affiliations, qualifications, languages, sources, verification_events, claims, content_pages, translations, audit_log, users, roles. Include geocoordinates, canonical IDs, timestamps, data provenance, and soft-delete status.

Build with a modern accessible web framework (e.g., Next.js/TypeScript), relational database with geospatial support, search indexing, secure admin console, role-based access, analytics, structured SEO metadata, and responsive design. Keep stack decisions consistent with the existing project if code is provided.

Seed only explicitly labeled demonstration records until real data can be lawfully sourced and validated. Do not fabricate neurologists, hospitals, phone numbers, emergency capability, certifications, or rankings. Use a repeatable ingestion and verification pipeline; support takedown/correction requests.

Trust, privacy, and safety

Obtain clinical review for medical content; cite Indian and international guidelines where applicable; show editorial dates. Comply with applicable Indian privacy and healthcare advertising rules following qualified legal review. Collect minimal user data, require consent for optional accounts, encrypt sensitive data, avoid collecting medical histories in MVP, and use explicit disclaimers that the service is not medical advice.

Monetization — after trust is established

Phase 1: free directory and stroke education. Phase 2: clearly labeled enhanced provider profiles, hospital SaaS listing management, multilingual educational sponsorships, and verified referral-navigation partnerships where legally permissible. Never sell rankings as quality, charge for emergency access, or imply payment equals clinical endorsement.

Build sequence and acceptance tests

Sprint 1: branding, responsive homepage, design system, FAST page, condition taxonomy. Sprint 2: state/city search, directory data model, listing and profile pages. Sprint 3: admin verification, claims and moderation, translations. Sprint 4: QA, accessibility, SEO, security review, pilot listings in 1–2 states, deployment.

Acceptance: every navigation link works; mobile layout at 360 px; English/Hindi toggle functions; searches filter correctly; missing data is clearly labeled; profiles show verification state; emergency page is accessible within one tap; no fabricated listings; automated tests and deployment documentation included.

Exact instruction to paste into Claude

“Use this PDF and its six embedded screenshots as the authoritative design and functional brief. Create a production-ready, India-first neurological care directory as a separate public website, not a subpage of TruckYeahTraders. Reuse visual motifs from the screenshots, especially child-friendly FAST education, learning game, and stroke-center locator, but redesign the navigation for a broader neurological directory. First output a sitemap, component architecture, database schema, and 3 responsive page mockups. Then implement the MVP with working search, placeholder/demo data clearly labeled, English/Hindi architecture, admin verification flow, tests, and deployment instructions. Ask for existing source code, brand assets, domain, hosting, and verified directory data before claiming production readiness. Do not invent providers or medical claims.”
